Period of the continued fraction of $\sqrt{n}$

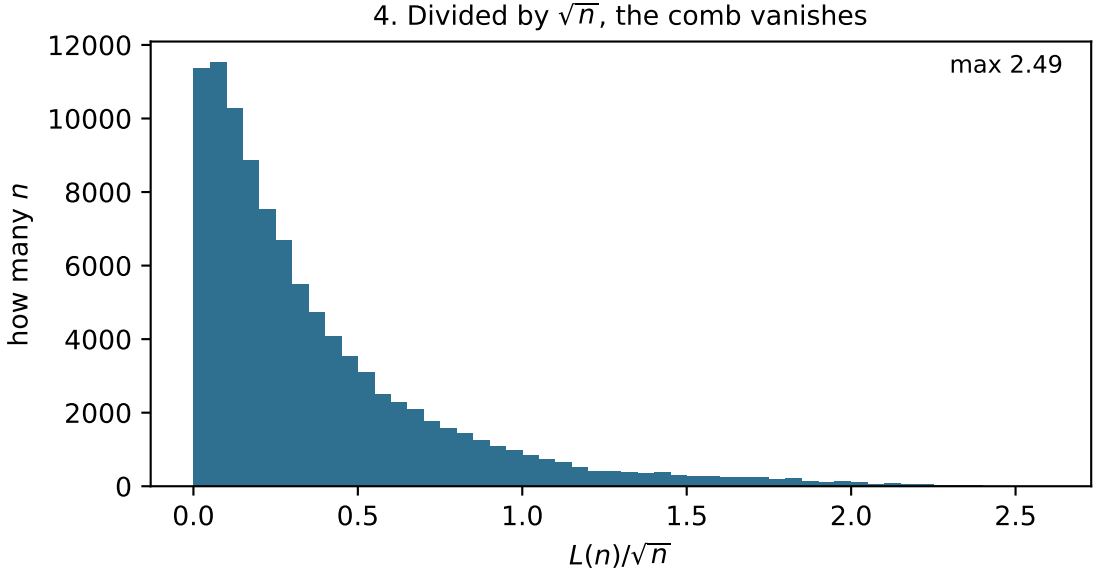

every non-square n from 2 to 99999 (99,683 values)

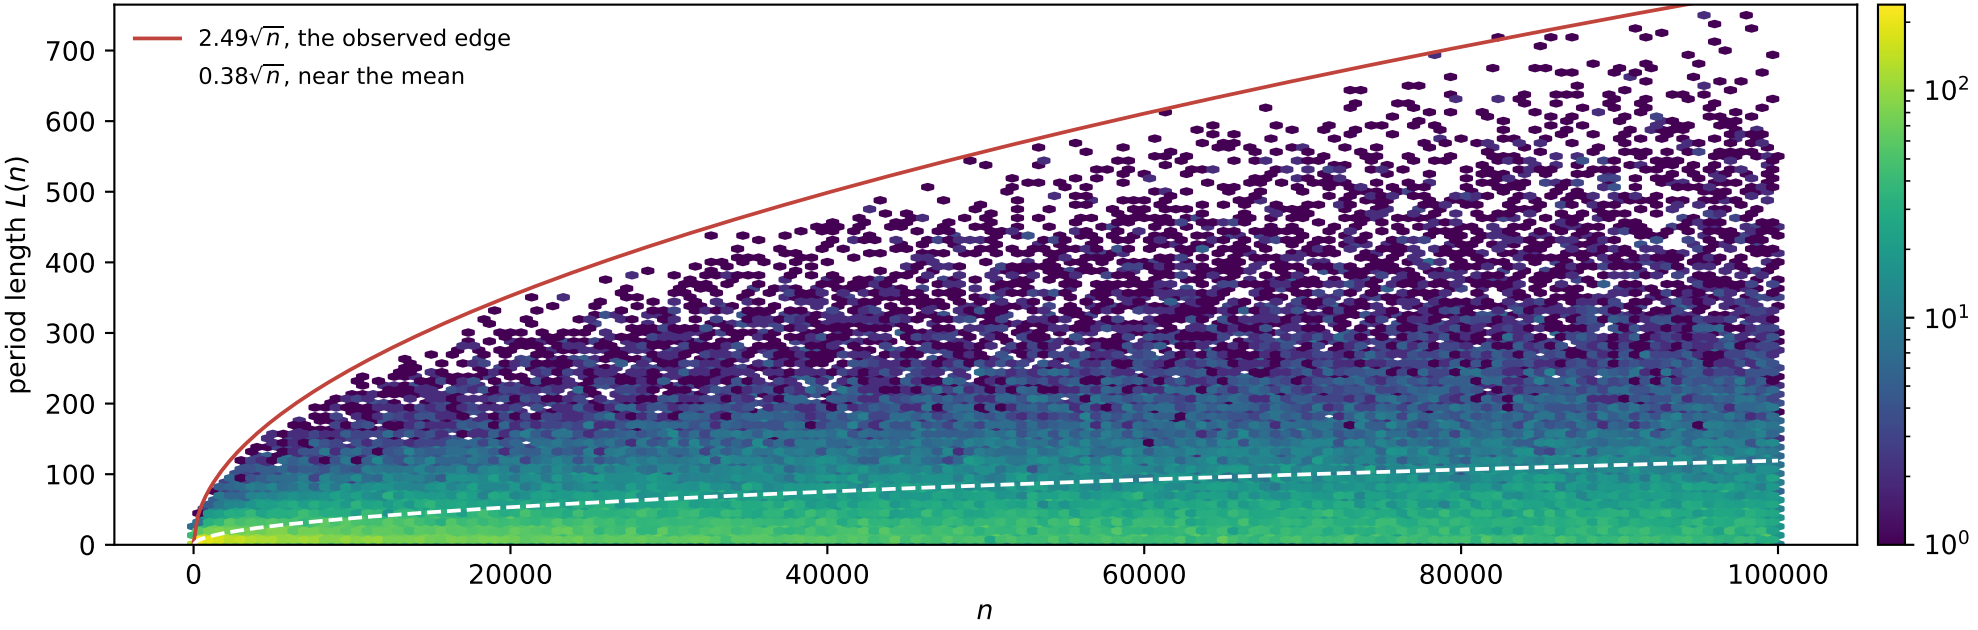

numbers with an odd period AND a prime factor 3 mod 4: 0

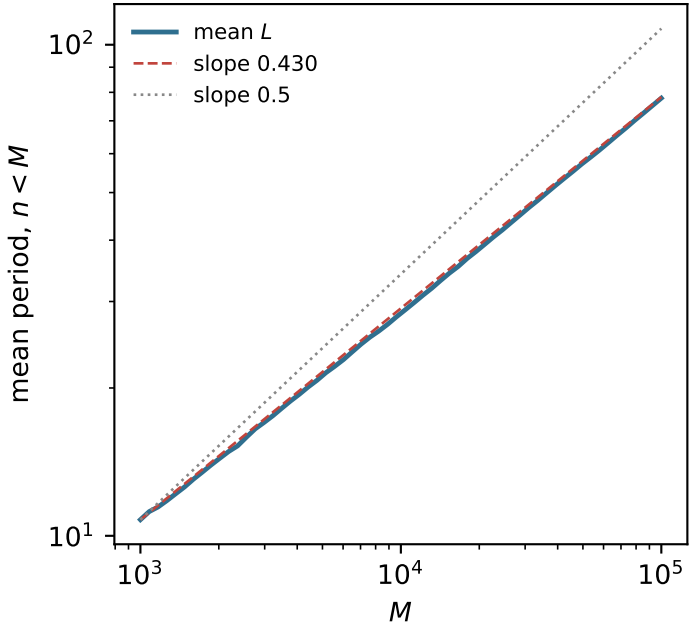

Growth, spread, and the edge

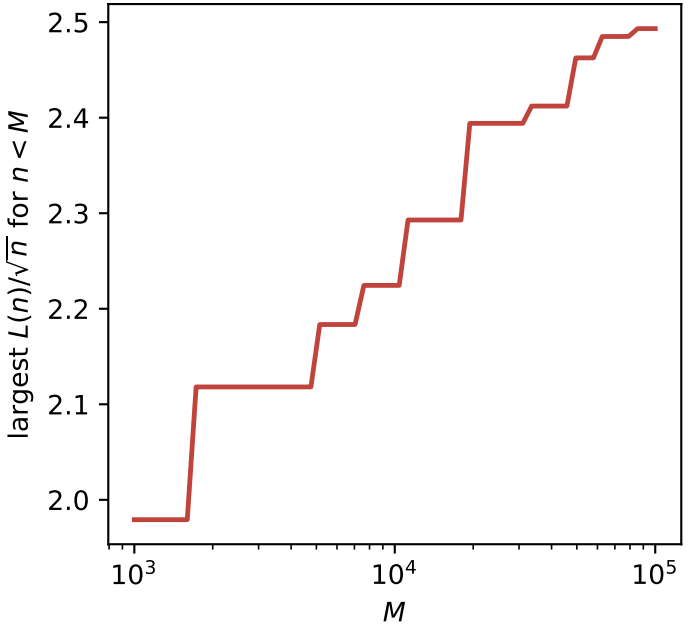

5. Every period, plotted against n (shading is how many, on a log scale)

6. The mean grows slower than $\sqrt{M}$

7. The right edge is not hard, it drifts

8. The full distribution, all period lengths
